

Hypertension Risk Assessment - Container Deployment

This directory contains the necessary configurations to build and run the Streamlit web application within an isolated Docker environment.

Prerequisites

- Ensure [Docker Desktop](#) is installed and running on your machine.

Quick Start Deployment

Because the Dockerfile references source files outside this folder, you must execute the build command from the **repository root directory** while pointing to this folder's configuration.

Open your terminal at the project root directory and execute:

```
# 1. Build the image using this folder's configuration from the root context
docker build -f container/Dockerfile -t hypertension-app .

# 2. Spin up the container and map the network port
docker run -p 8501:8501 --name hypertension-instance hypertension-app
```
